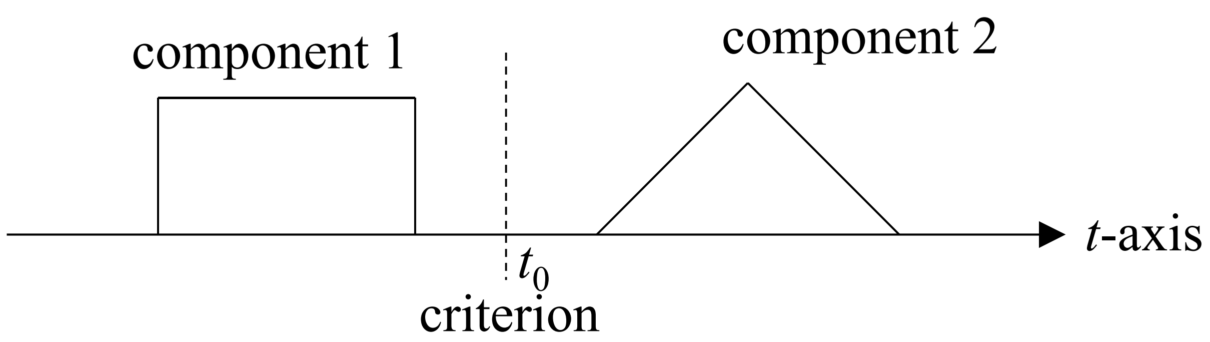
IX. Applications of Time-Frequency Analysis for Filter Design

9-1 Signal Decomposition and Filter Design

Signal Decomposition: Decompose a signal into several components.

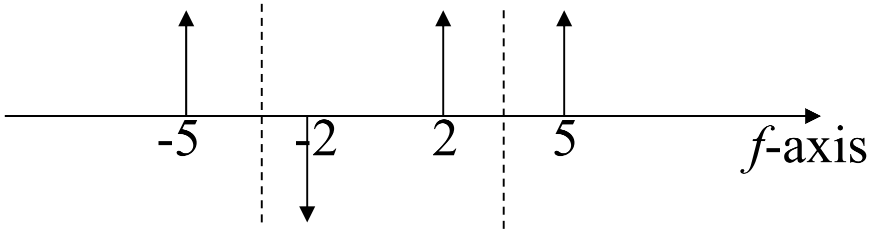
Filter: Remove the undesired component of a signal

(1) Decomposing in the time domain



(2) Decomposing in the frequency domain

$$x(t) = \sin(4\pi t) + \cos(10\pi t)$$



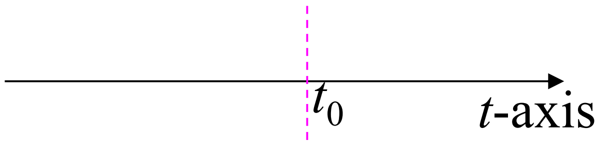
- Sometimes, signal and noise are separable in the time domain →
  (1) without any transform

- Sometimes, signal and noise are separable in the frequency domain →
  (2) using the FT (conventional filter)

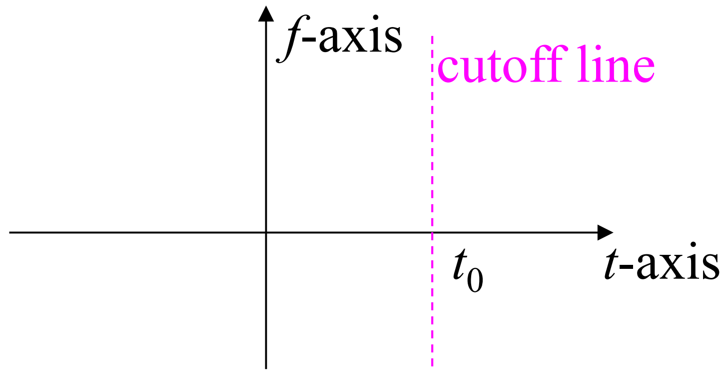
$$x_o(t) = IFT\left[FT(x_i(t))H(f)\right]$$

- If signal and noise are not separable in both the time and the frequency domains →
  (3) Using the fractional Fourier transform and time-frequency analysis

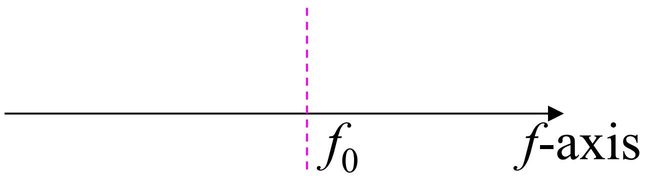
以時頻分析的觀點，criterion in the time domain 相當於 cutoff line perpendicular to t-axis



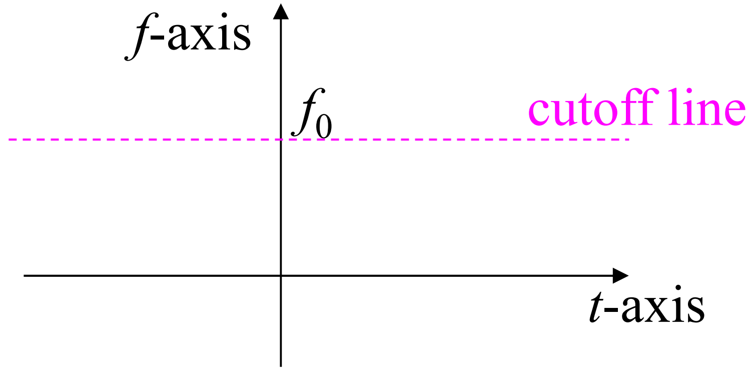
=



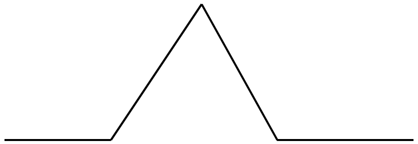
以時頻分析的觀點，criterion in the frequency domain 相當於 cutoff line perpendicular to f-axis

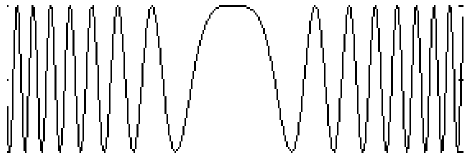


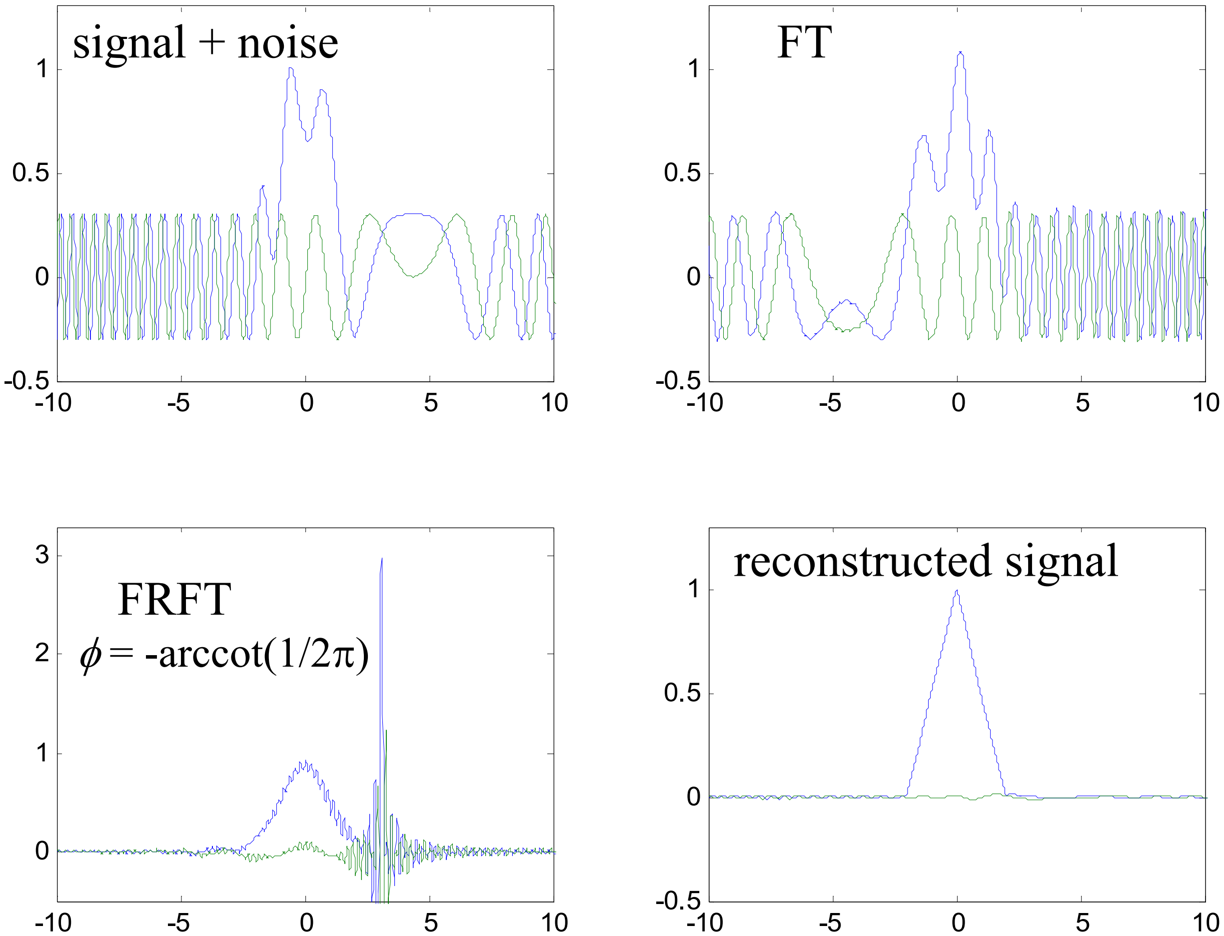
=



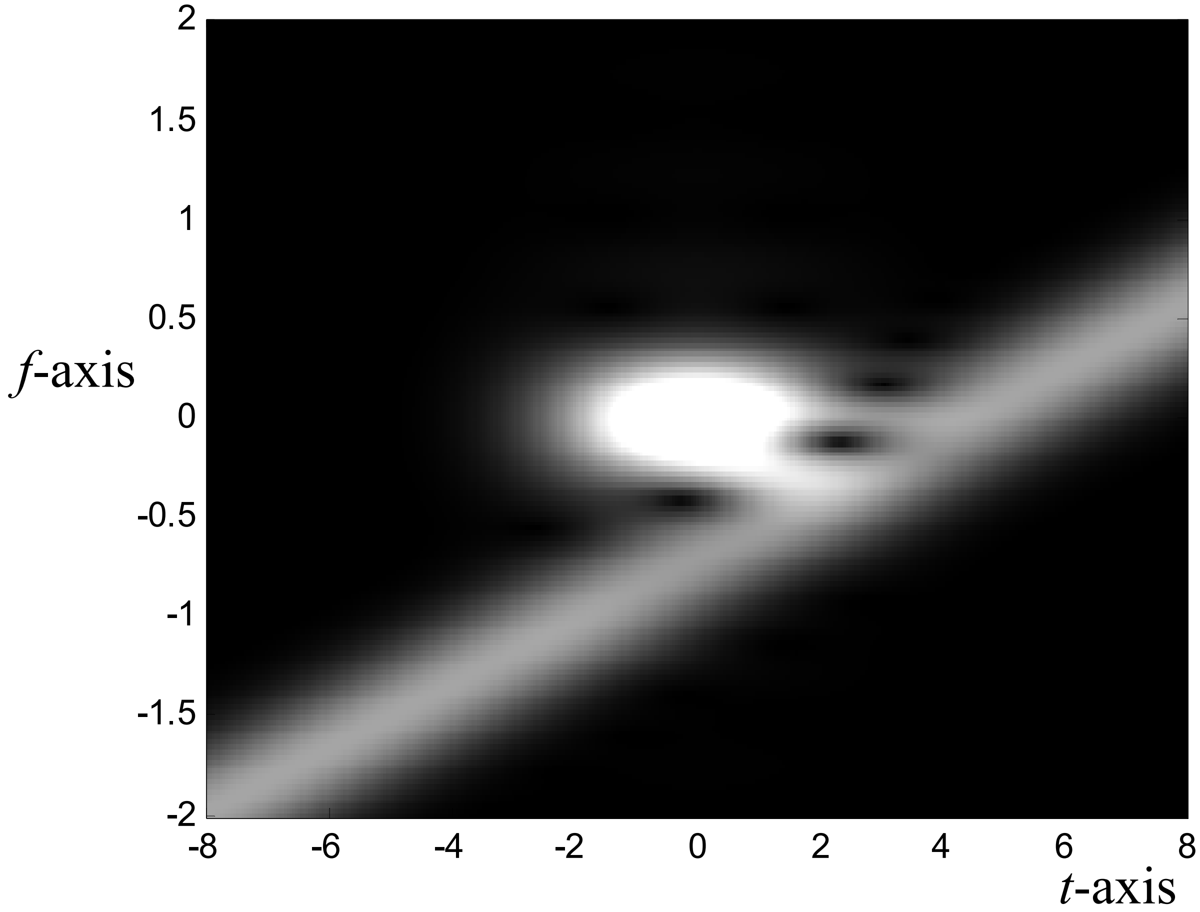
$x(t)$ = triangular signal + chirp noise $0.3\exp[j\ 0.5(t-4.4)^2]$







$x(t)$ = triangular signal + chirp noise $0.3\exp[j\,0.5(t-4.4)^2]$



Decomposing in the time-frequency distribution

If $x(t) = 0$ for $t < T_1$ and $t > T_2$

$W_x(t, f) = 0$ for $t < T_1$ and $t > T_2$ (cutoff lines perpendicular to t-axis)

If $X(f) = FT[x(t)] = 0$ for $f < F_1$ and $f > F_2$

$W_x(t, f) = 0$ for $f < F_1$ and $f > F_2$ (cutoff lines parallel to t-axis)

What are the cutoff lines with other directions?

with the aid of the **FRFT**, the LCT, or the Fresnel transform

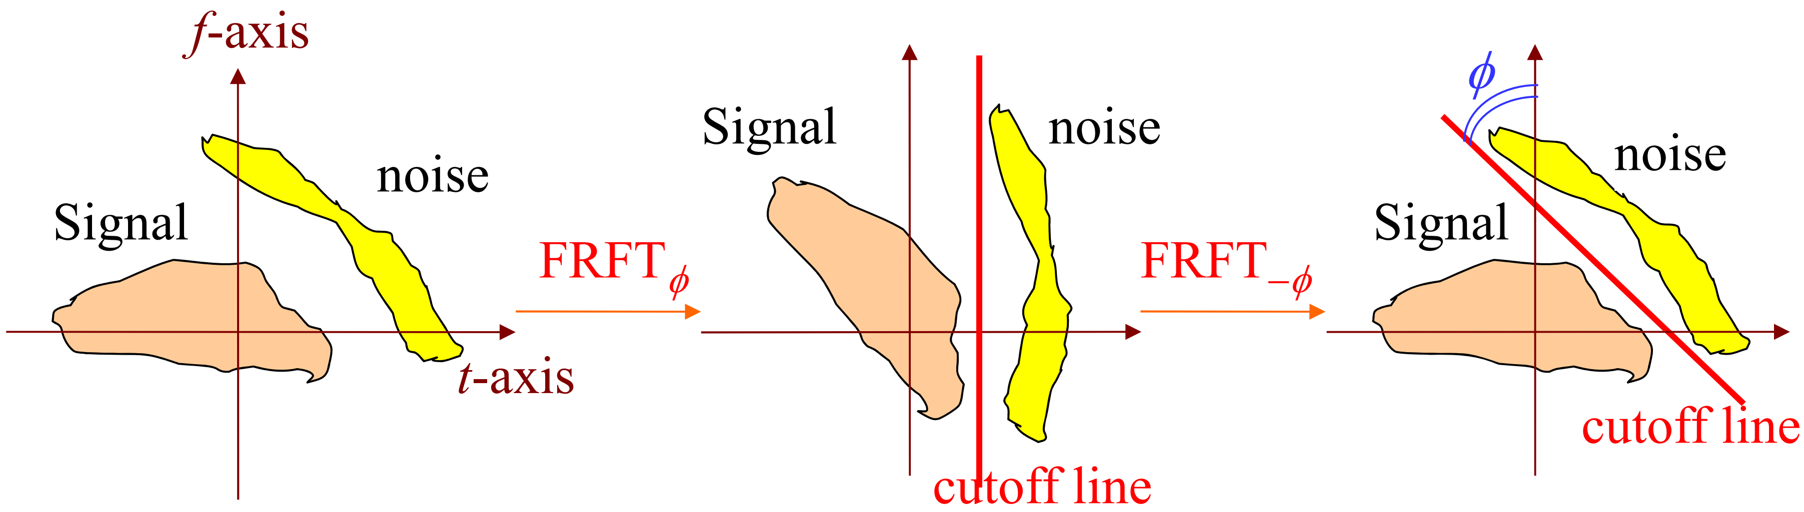
- Filter designed by the fractional Fourier transform

$$x_o(t) = O_F^{-\phi}\left\{O_F^{\phi}\left[x_i(t)\right]H(u)\right\}$$

比較： $x_o(t) = IFT\left[FT(x_i(t))H(f)\right]$

O_F^{ϕ} means the fractional Fourier transform:

$$O_F^{\phi}\left(x(t)\right) = \sqrt{1 - j\cot\phi}\; e^{j\pi\cot\phi\cdot u^2}\int_{-\infty}^{\infty} e^{-j2\pi\cdot\csc\phi\cdot u\,t}\, e^{j\pi\cdot\cot\phi\cdot t^2}\, x(t)\,dt$$

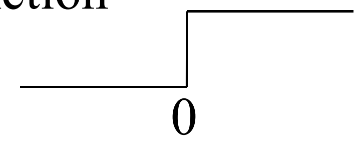


$$x_o(t) = O_F^{-\phi}\left\{O_F^{\phi}\left[x_i(t)\right]H(u)\right\}$$

If $\quad H(u) = S(-u+u_0) \qquad H(u) = \begin{cases} 1 & u < u_0 \\ 0 & u > u_0 \end{cases}$

If $\quad H(u) = S(u-u_0) \qquad H(u) = \begin{cases} 1 & u > u_0 \\ 0 & u < u_0 \end{cases}$

$S(u)$: Step function



(1) ϕ 由 cutoff line 和 f-axis 的夾角決定

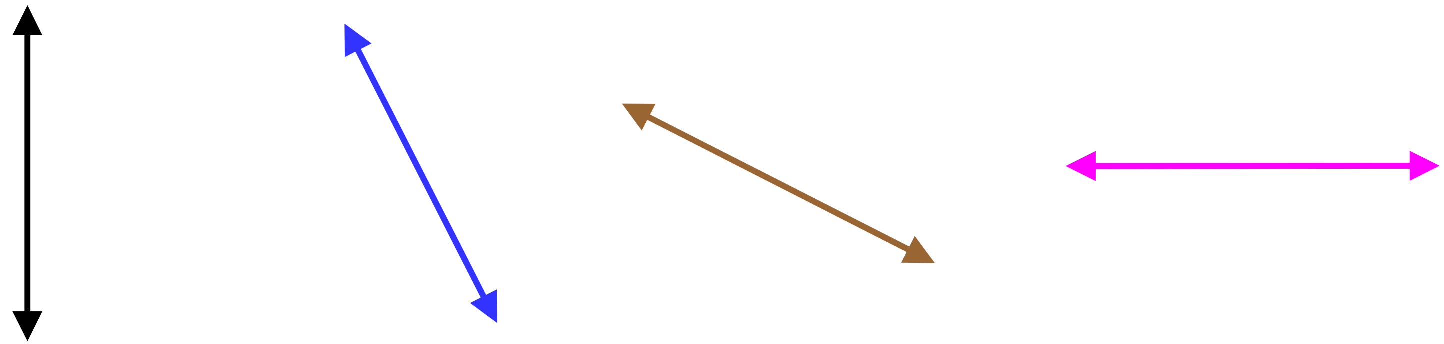
(2) u_0 等於 cutoff line 距離原點的距離

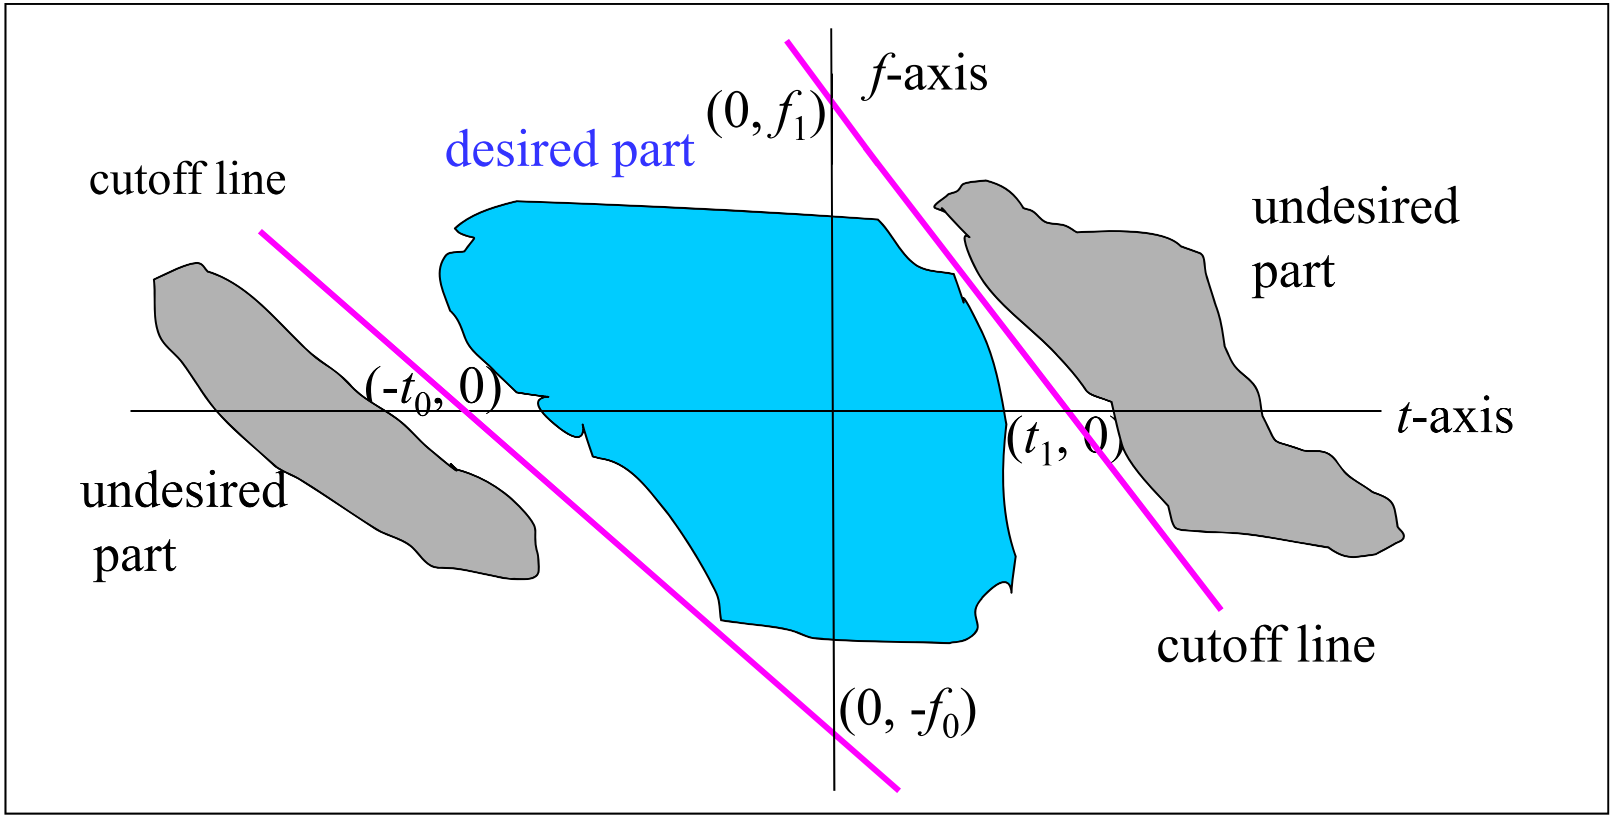
(注意正負號)

- Effect of the filter designed by the fractional Fourier transform (FRFT):

  Placing a cutoff line in the direction of $(-\sin\phi, \cos\phi)$

$\phi = 0$ (time domain) $\quad$ $\phi = 0.15\pi$ $\quad$ $\phi = 0.35\pi$ $\quad$ $\phi = 0.5\pi$ (FT)





f-axis
$(0, f_1)$
desired part
cutoff line
undesired part
$(-t_0, 0)$
t-axis
$(t_1, 0)$
undesired part
cutoff line
$(0, -f_0)$

$\phi = ?$ $\quad u_0 = ?$

- The Fourier transform is suitable to filter out the noise that is a combination of

  sinusoid functions $\exp(jn_1 t)$.

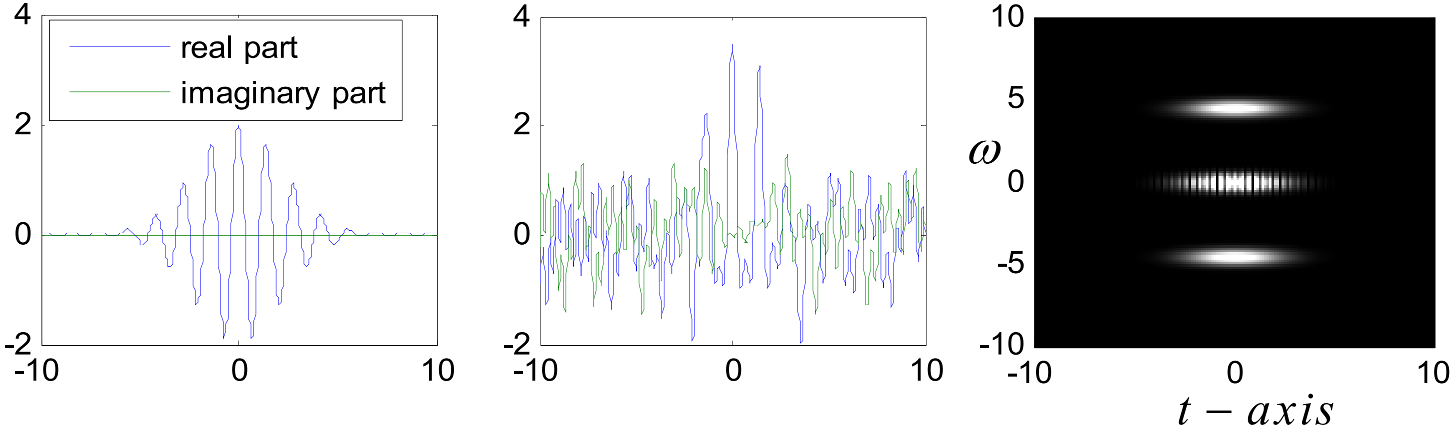
- The fractional Fourier transform (FRFT) is suitable to filter out the noise that is a combination of higher order exponential functions

  $\exp[j(n_k t^k + n_{k-1} t^{k-1} + n_{k-2} t^{k-2} + \ldots\ldots + n_2 t^2 + n_1 t)]$

  For example: chirp function $\exp(jn_2 t^2)$

- With the FRFT, many noises that cannot be removed by the FT will be filtered out successfully.

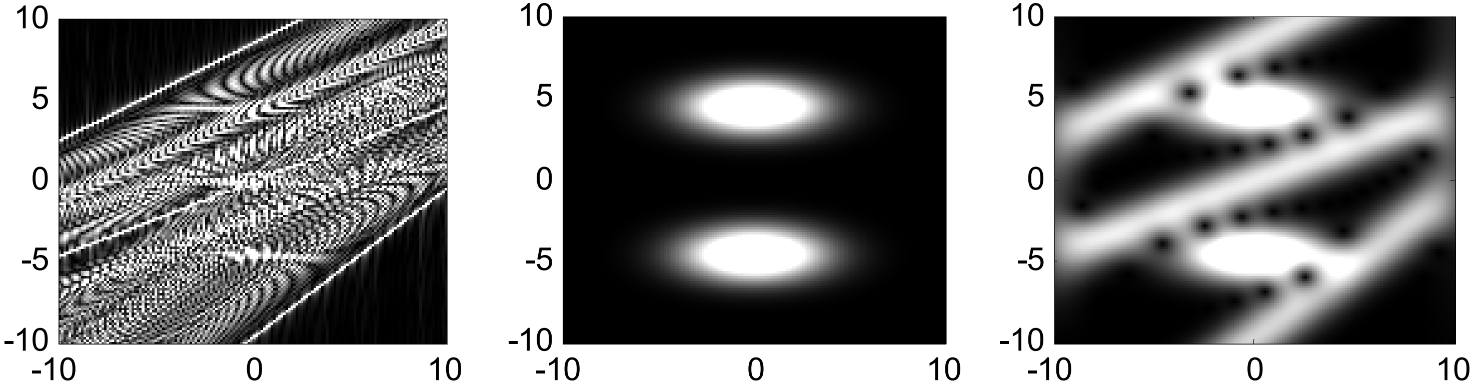
Example (I)



(a) Signal $s(t)$ (b) $f(t) = s(t)$ + noise (c) WDF of $s(t)$

$$s(t) = 2\cos(5t)\exp(-t^2/10)$$

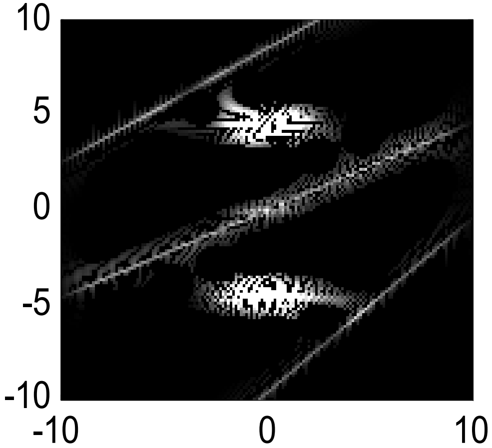
$$n(t) = 0.5e^{j0.23t^2} + 0.5e^{j0.3t^2 + j8.5t} + 0.5e^{j0.46t^2 - j9.6t}$$



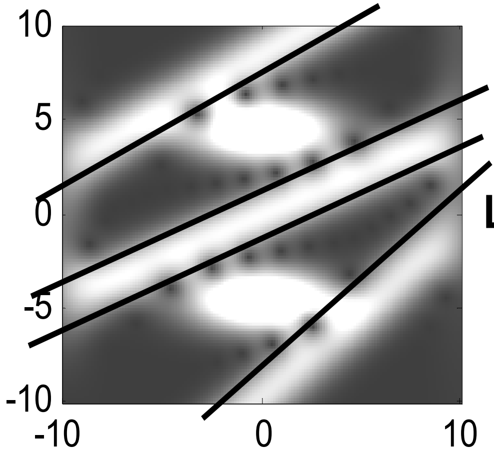
(d) WDF of $f(t)$ (e) GT of $s(t)$ (f) GT of $f(t)$

GT: Gabor transform, WDF: Wigner distribution function

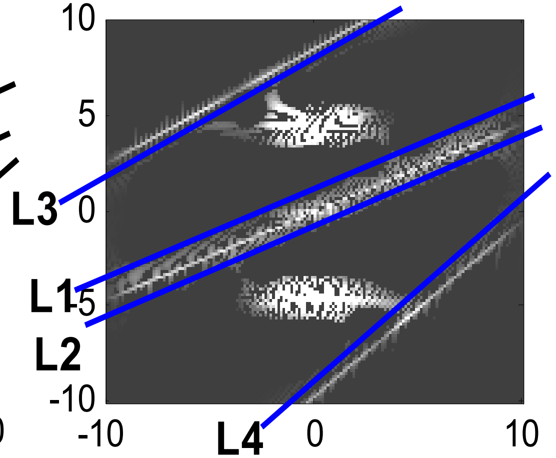
horizontal: t-axis, vertical: ω-axis



(g) GWT of $f(t)$

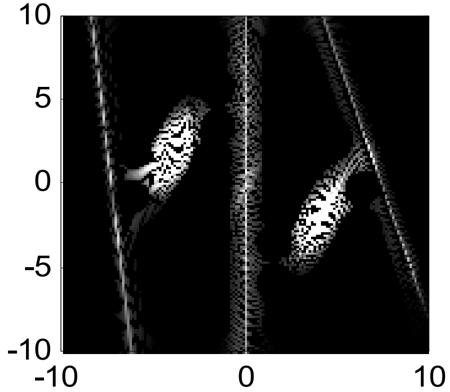


(h) Cutoff lines on GT

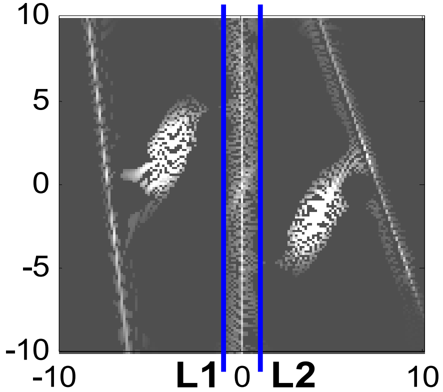


(i) Cutoff lines on GWT

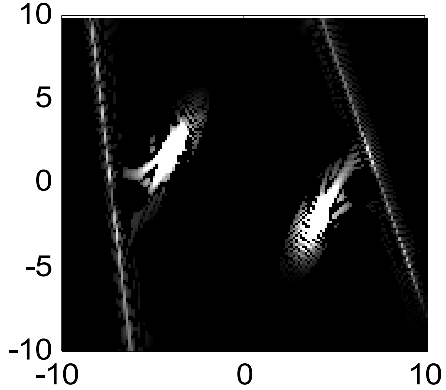
根據斜率來決定 FrFT 的 order



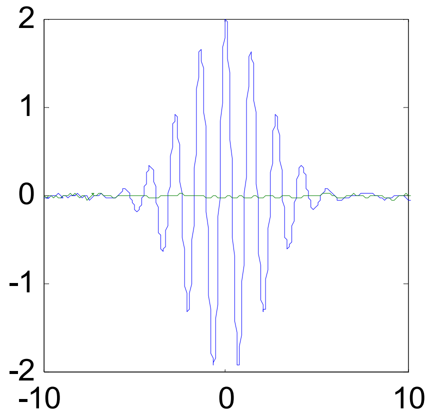
(j) performing the FRFT and calculate the GWT



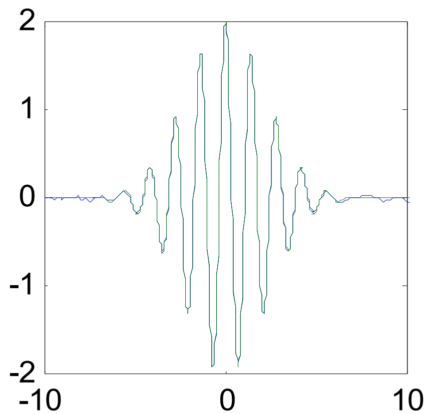
(k) High pass filter



(l) GWT after filter



(m) recovered signal

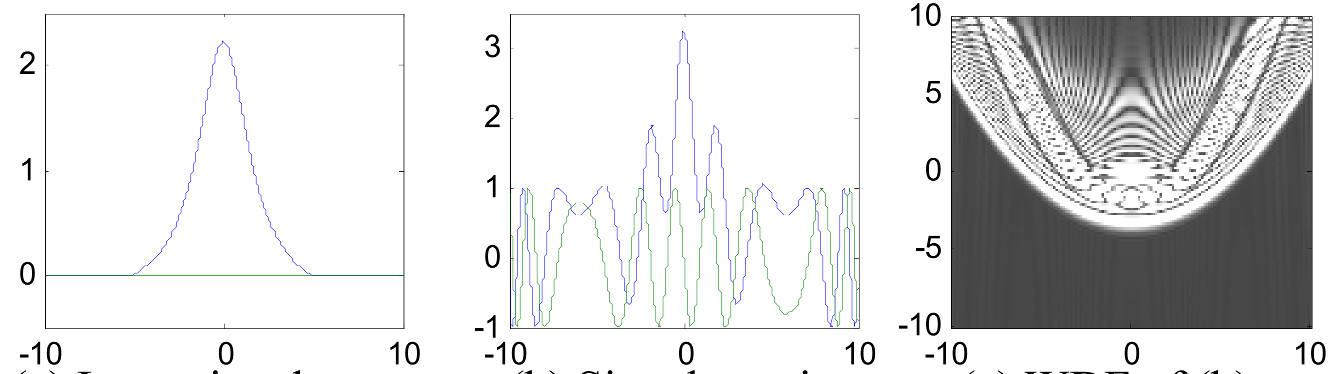


(n) recovered signal (green) and the original signal (blue)

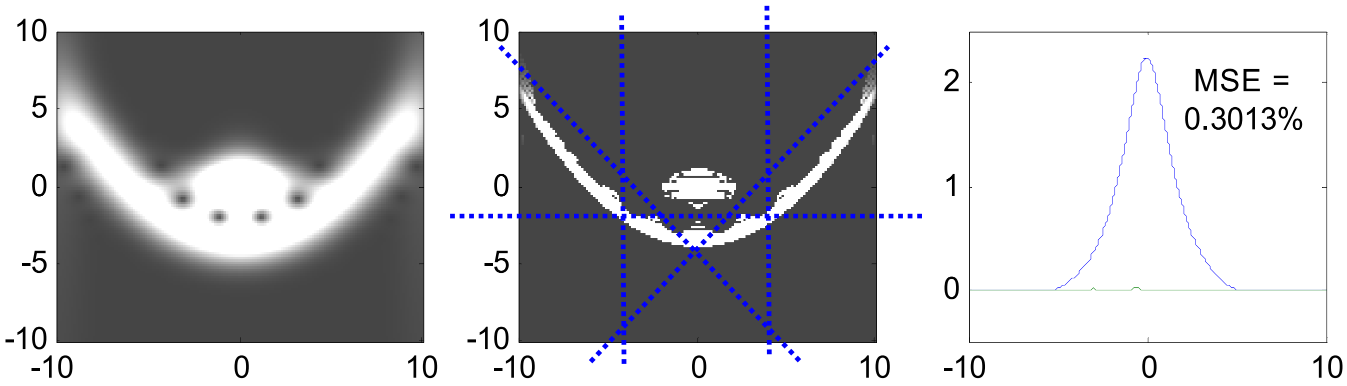
mean square error (MSE) = 0.1128%

Example (II)

Signal + $0.7\exp(j0.032t^3 - j3.4t)$



(a) Input signal (b) Signal + noise (c) WDF of (b)



(d) Gabor transform of (b) (e) GWT of (b) (f) Recovered signal

[Important Theory]:

Using the **FT** can only filter the noises that do not overlap with the signals **in the frequency domain** (1-D)

In contrast, using the **FRFT** can filter the noises that do not overlap with the signals **on the time-frequency plane** (2-D)

[思考]

Q1: 哪些 time-frequency distribution 比較適合處理 filter 或 signal decomposition 的問題？

Q2: Cutoff lines 有可能是非直線的嗎？

9-2 TF analysis and Random Process

For a random process $x(t)$, we cannot find the explicit value of $x(t)$. The value of $x(t)$ is expressed as a probability function.

- Auto-covariance function $R_x(t,\tau)$

$$R_x(t,\tau) = E\left[x(t+\tau/2)x^*(t-\tau/2)\right]$$

In usual, we suppose that $E[x(t)] = 0$ for any t

$$E\left[x(t+\tau/2)x^*(t-\tau/2)\right]$$
$$= \int\int x(t+\tau/2,\zeta_1)x^*(t-\tau/2,\zeta_2)P(\zeta_1,\zeta_2)\,d\zeta_1 d\zeta_2$$

(alternative definition of the auto-covariance function:

$$\hat{R}_x(t,\tau) = E\left[x(t)x^*(t-\tau)\right]$$

- Power spectral density (PSD) $S_x(t,f)$

$$S_x(t,f) = \int_{-\infty}^{\infty} R_x(t,\tau)e^{-j2\pi f\tau}d\tau$$

- Relation between the WDF and the random process

$$E\left[W_x(t,f)\right]=\int_{-\infty}^{\infty}E\left[x(t+\tau/2)x^*(t-\tau/2)\right]\cdot e^{-j2\pi f\tau}\cdot d\tau$$

$$=\int_{-\infty}^{\infty}R_x(t,\tau)\cdot e^{-j2\pi f\tau}\cdot d\tau$$

$$=\int_{-\infty}^{\infty}R_x(t,\tau)\cdot e^{-j2\pi f\tau}\cdot d\tau$$

$$=S_x(t,f)$$

- Relation between the ambiguity function and the random process

$$E\left[A_x(\eta,\tau)\right]=\int_{-\infty}^{\infty}E\left[x(t+\tau/2)x^*(t-\tau/2)\right]e^{-j2\pi t\eta}\,dt=\int_{-\infty}^{\infty}R_x(t,\tau)e^{-j2\pi t\eta}\,dt$$

- Stationary random process:

the statistical properties do not change with t.

Auto-covariance function $R_x\left(t_1,\tau\right)=R_x\left(t_2,\tau\right)=R_x\left(\tau\right)$ for any t,

$$R_x\left(\tau\right)=E\left[x(\tau/2)x^*(-\tau/2)\right]$$

$$=\int\int x(\tau/2,\zeta_1)x^*(-\tau/2,\zeta_2)P\left(\zeta_1,\zeta_2\right)d\zeta_1 d\zeta_2$$

PSD: $S_x\left(f\right)=\int_{-\infty}^{\infty}R_x\left(\tau\right)e^{-j2\pi f\tau}d\tau$

White noise: $S_x\left(f\right)=\sigma$ where σ is some constant.

$$R_x\left(\tau\right)=\sigma\delta\left(\tau\right)$$

• When $x(t)$ is stationary,

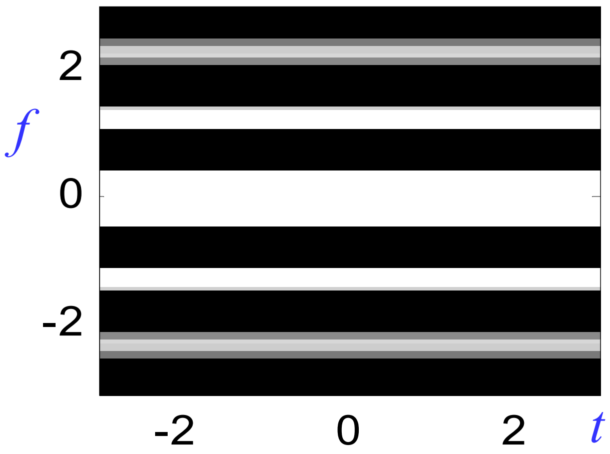
$$E\left[W_x(t,f)\right] = S_x(f)$$

(invariant with t)

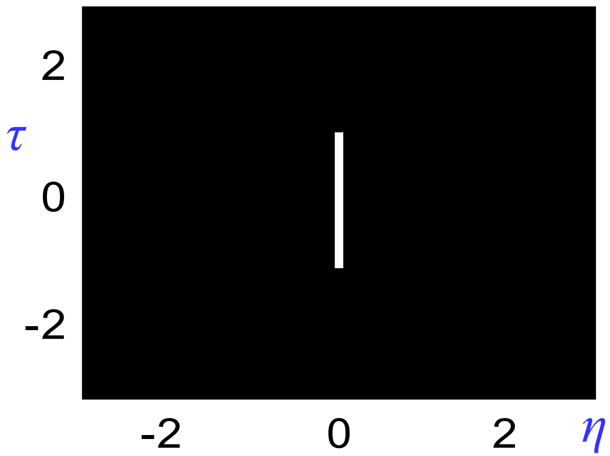
$$E\left[A_x(\eta,\tau)\right] = \int_{-\infty}^{\infty} R_x(\tau)\cdot e^{-j2\pi t\eta}\cdot dt = R_x(\tau)\int_{-\infty}^{\infty}\cdot e^{-j2\pi t\eta}\cdot dt = R_x(\tau)\delta(\eta)$$

(nonzero only when $\eta = 0$)

a typical $E[W_x(t,f)]$ for stationary random process



a typical $E[A_x(\eta, \tau)]$ for stationary random process



- For white noise,

$$E\left[W_x\left(t,f\right)\right]=\sigma$$

$$E\left[A_x\left(\eta,\tau\right)\right]=\sigma\delta\left(\tau\right)\delta\left(\eta\right)$$

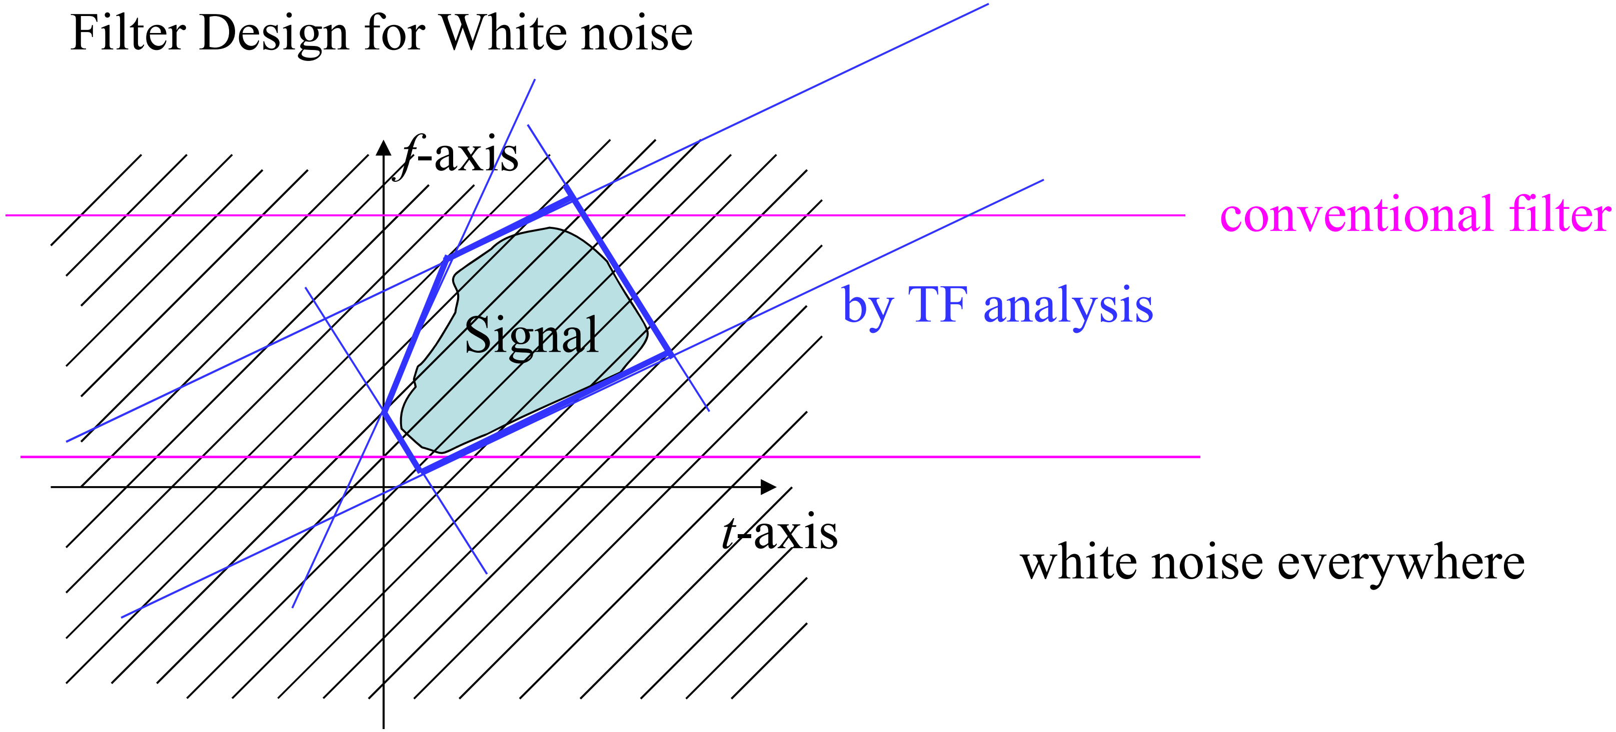
[Ref 1] W. Martin, "Time-frequency analysis of random signals", *ICASSP'82*, pp. 1325-1328, 1982.

[Ref 2] W. Martin and P. Flandrin, "Wigner-Ville spectrum analysis of nonstationary processed", *IEEE Trans. ASSP*, vol. 33, no. 6, pp. 1461-1470, Dec. 1983.

[Ref 3] P. Flandrin, "A time-frequency formulation of optimum detection" , *IEEE Trans. ASSP*, vol. 36, pp. 1377-1384, 1988.

[Ref 4] S. C. Pei and J. J. Ding, "Fractional Fourier transform, Wigner distribution, and filter design for stationary and nonstationary random processes," *IEEE Trans. Signal Processing*, vol. 58, no. 8, pp. 4079-4092, Aug. 2010.

Filter Design for White noise



$$SNR \approx 10\log_{10}\frac{E_{signal}}{\iint\limits_{\substack{(t,f)\in \\ \text{signal part}}} W_{noise}(t,f)\,dt\,df}$$

E_{signal}: energy of the signal

A: area of the time frequency distribution of the signal

$$SNR \approx 10\log_{10}\frac{E_{signal}}{\sigma A}$$

The PSD of the white noise is $S_{noise}(f) = \sigma$

- If $E\left[W_x(t,f)\right]$ varies with t and $E\left[A_x(\eta,\tau)\right]$ is nonzero when $\eta \neq 0$,

then $x(t)$ is a non-stationary random process.

- If ① $h(t) = x_1(t) + x_2(t) + x_3(t) + \cdots\cdots + x_k(t)$

② $x_n(t)$'s have zero mean for all t's

③ $x_n(t)$'s are mutually independent for all t's and τ's

$$E\left[x_m(t+\tau/2)x_n^*(t-\tau/2)\right] = E\left[x_m(t+\tau/2)\right]E\left[x_n^*(t-\tau/2)\right] = 0$$

if $m \neq n$, then

$$E\left[W_h(t,f)\right] = \sum_{n=1}^{k} E\left[W_{x_n}(t,f)\right], \quad E\left[A_h(\eta,\tau)\right] = \sum_{n=1}^{k} E[A_{x_n}(\eta,\tau)]$$

(1) Random process for the STFT

$E[x(t)] \neq 0$ should be satisfied.

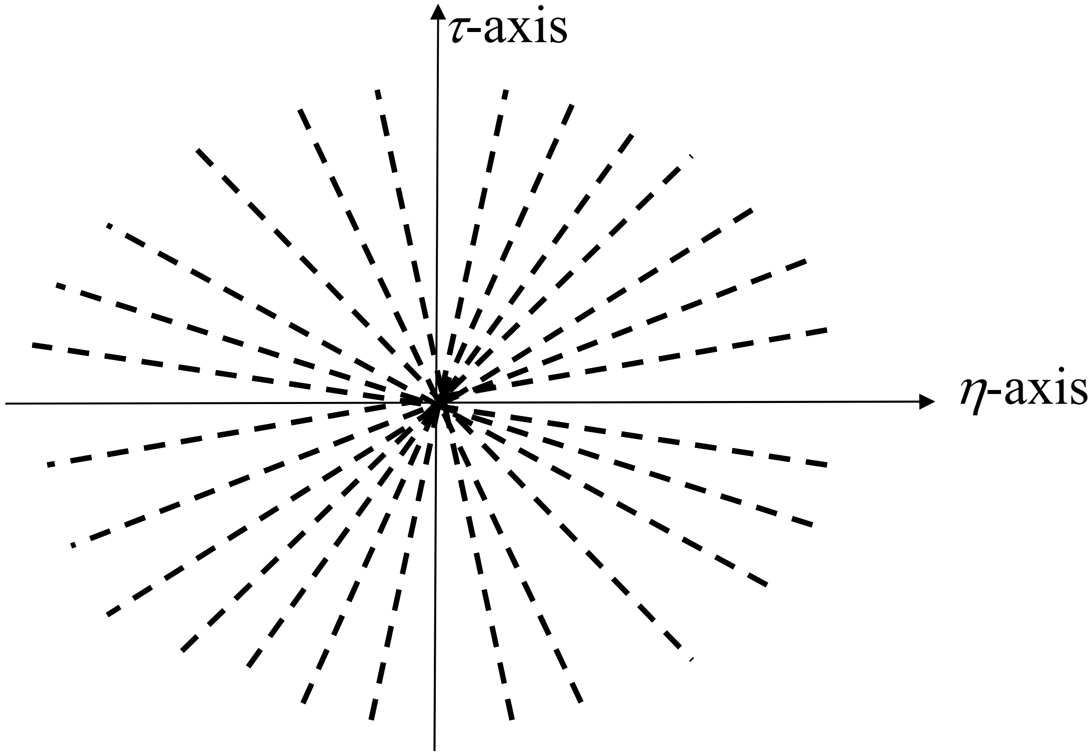
Otherwise,

$$E[X(t,f)] = E[\int_{t-B}^{t+B} x(\tau)w(t-\tau)e^{-j2\pi f\tau}d\tau] = \int_{t-B}^{t+B} E[x(\tau)]w(t-\tau)e^{-j2\pi f\tau}d\tau$$

for zero-mean random process, $E[X(t, f)] = 0$

(2) Decompose by the AF and the FRFT

Any non-stationary random process can be expressed as a summation of the fractional Fourier transform (or chirp multiplication) of stationary random process.



An ambiguity function plane can be viewed as a combination of infinite number of radial lines.

Each radial line can be viewed as the fractional Fourier transform of a stationary random process.

信號處理小常識

$$S(f) = \sigma$$ white noise

$$S(f) = \frac{\sigma}{|f|}$$

$$S(f) = \sigma|f|$$

$$S(f) = \sigma|f|^{\alpha}$$ $\alpha \neq 0$ color noise

X. Other Applications of Time-Frequency Analysis

(21) Astronomy
(22) Oceanography
(23) Satellite Signal Analysis
(24) Image Processing??

10-1 Sampling Theory

Number of sampling points == Sum of areas of time frequency distributions
+ the number of extra parameters

- How to make the area of time-frequency smaller?

(1) Divide into several components.

(2) Use chirp multiplications, chirp convolutions, fractional Fourier transforms, or linear canonical transforms to reduce the area.

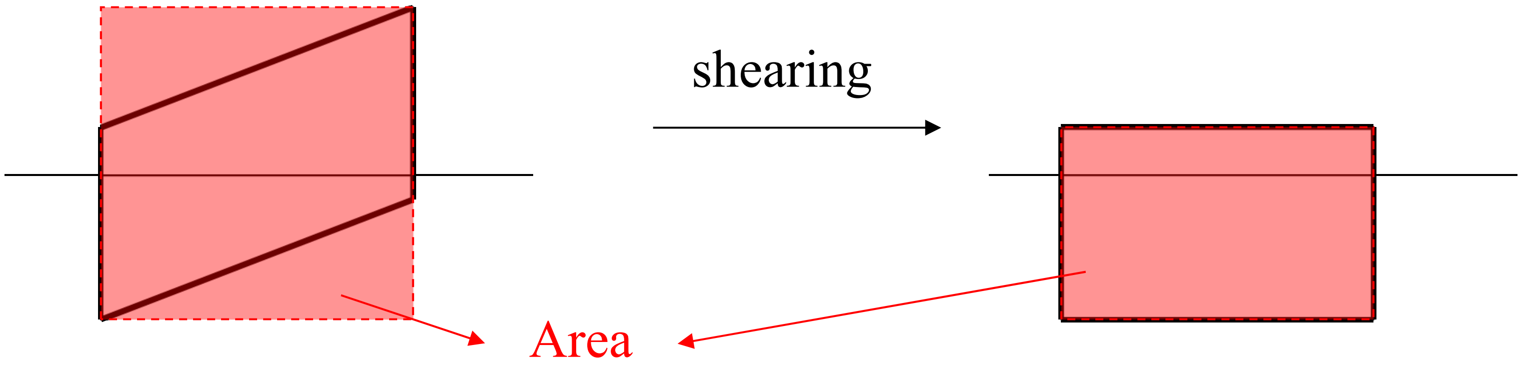
[Ref] X. G. Xia, "On bandlimited signals with fractional Fourier transform," *IEEE Signal Processing Letters*, vol. 3, no. 3, pp. 72-74, March 1996.

[Ref] J. J. Ding, S. C. Pei, and T. Y. Ko, "Higher order modulation and the efficient sampling algorithm for time variant signal," *European Signal Processing Conference*, pp. 2143-2147, Bucharest, Romania, Aug. 2012.

Analytic Signal Conversion

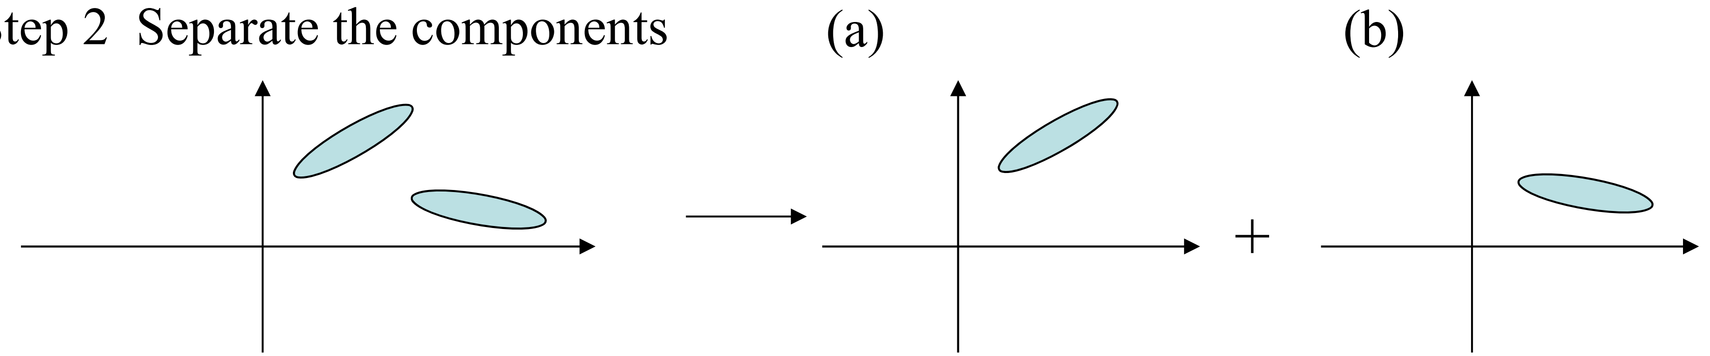
$$x(t) \rightarrow x_a(t) = x(t) + jx_H(t)$$

Shearing



Step 1 Analytic Signal Conversion

Step 2 Separate the components



Step 3 Use shearing or rotation to minimize the “area” to each component

Step 4 Use the conventional sampling theory to sample each components

傳統的取樣方式

$$x_d[n] = x(n\Delta_t) \qquad \Delta_t < 1/F$$

重建：
$$x(t) = \sum_n x_d[n]\,\text{sinc}\left(\frac{t}{\Delta_t} - n\right)$$

新的取樣方式

$x_H(t)$: Hilbert transform of $x(t)$

(1) $x(t) \to x_a(t) = x(t) + jx_H(t)$

(2) $x_a(t) \to x_a(t) = x_1(t) + x_2(t) + \cdots + x_K(t)$

(3) $y_k(t) = \exp\left(j2\pi a_k t^2\right) x_k(t) \qquad k = 1, 2, \ldots, K$

(4) $x_{d,k}[n] = y_k\left(n\Delta_{t,k}\right) \qquad k = 1, 2, \ldots, K$

$$= \exp\left(j2\pi a_k n^2 \Delta_{t,k}^2\right) x_k\left(n\Delta_{t,k}\right)$$

重建：

(1) $y_k(t) = \sum_n x_{d,k}[n] \operatorname{sinc}\left(\frac{t}{\Delta_{t,k}} - n\right)$

(2) $x_k(t) = \exp\left(-j2\pi a_k t^2\right) y_k(t)$

(3) $x_a(t) = x_1(t) + x_2(t) + \cdots + x_K(t)$

(4) $x(t) = \mathcal{Re}\left\{x_a(t)\right\}$

嚴格來說，沒有一個信號的 時頻分佈的「面積」是有限的。

Theorem:

If $x(t)$ is time limited ($x(t) = 0$ for $t < t_1$ and $t > t_2$)

then it is impossible to be frequency limited

If $x(t)$ is frequency limited ($X(f) = 0$ for $f < f_1$ and $f > f_2$)

then it is impossible to be time limited

但是我們可以選一個 “threshold” Δ

時頻分析 $|X(t, f)| > \Delta$ 或 的區域的面積是有限的

實際上，以「面積」來討論取樣點數，是犠牲了一些精確度。

只取 $t \in [t_1, t_2]$ and $f \in [f_1, f_2]$ 犧牲的能量所佔的比例

$$err = \frac{\int_{-\infty}^{t_1} |x(t)|^2 dt + \int_{t_2}^{\infty} |x(t)|^2 dt + \int_{-\infty}^{f_1} |X_1(f)|^2 df + \int_{f_2}^{\infty} |X_1(f)|^2 df}{\int_{-\infty}^{\infty} |x(t)|^2 dt}$$

$\boxed{X_1(f) = FT[x_1(t)],}$ $x_1(t) = x(t)$ for $t \in [t_1, t_2]$, $x_1(t) =$ 0 otherwise

- For the Wigner distribution function (WDF)

$$|x(t)|^2 = \int_{-\infty}^{\infty} W_x(t,f)\,df, \qquad |X(f)|^2 = \int_{-\infty}^{\infty} W_x(t,f)\,dt$$

$$\int_{-\infty}^{\infty}\int_{-\infty}^{\infty} W_x(t,f)\,df\,dt = \int_{-\infty}^{\infty} |x(t)|^2 dt \quad = \quad \text{energy of } x(t).$$

$$|x(t)|^2 = \int_{-\infty}^{\infty} W_x(t,f)\,df \qquad |X(f)|^2 = \int_{-\infty}^{\infty} W_x(t,f)\,dt$$

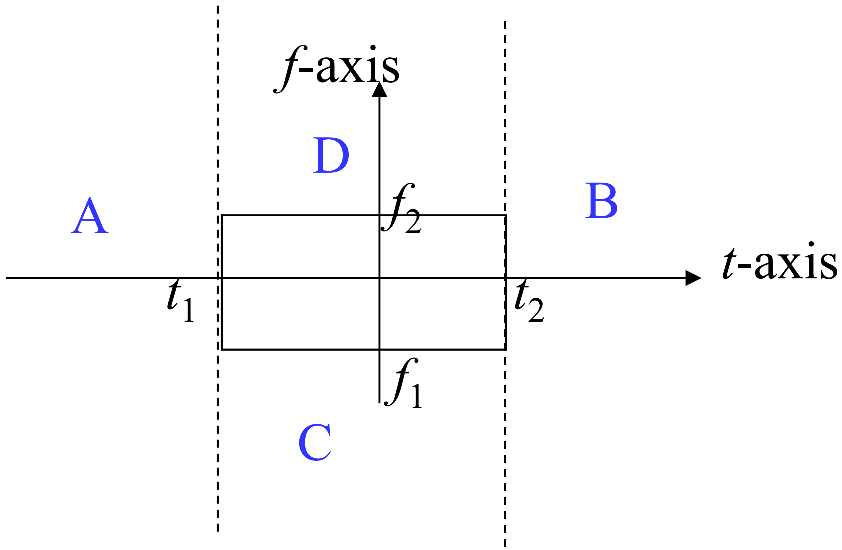
$$\int_{-\infty}^{t_1} |x(t)|^2\,dt + \int_{t_2}^{\infty} |x(t)|^2\,dt + \int_{-\infty}^{f_1} |X_1(f)|^2\,df + \int_{f_2}^{\infty} |X_1(f)|^2\,df$$

$$= \int_{-\infty}^{t_1}\int_{-\infty}^{\infty} W_x(t,f)\,dfdt + \int_{t_2}^{\infty}\int_{-\infty}^{\infty} W_x(t,f)\,dfdt + \int_{-\infty}^{\infty}\int_{-\infty}^{f_1} W_{x_1}(t,f)\,dfdt + \int_{-\infty}^{\infty}\int_{f_2}^{\infty} W_{x_1}(t,f)\,dfdt$$

$$= \int_{-\infty}^{t_1}\int_{-\infty}^{\infty} W_x(t,f)\,dfdt + \int_{t_2}^{\infty}\int_{-\infty}^{\infty} W_x(t,f)\,dfdt + \int_{t_1}^{t_2}\int_{-\infty}^{f_1} W_{x_1}(t,f)\,dfdt + \int_{t_1}^{t_2}\int_{f_2}^{\infty} W_{x_1}(t,f)\,dfdt$$

$$\cong \underbrace{\int_{-\infty}^{t_1}\int_{-\infty}^{\infty} W_x(t,f)\,dfdt}_{A} + \underbrace{\int_{t_2}^{\infty}\int_{-\infty}^{\infty} W_x(t,f)\,dfdt}_{B} + \underbrace{\int_{t_1}^{t_2}\int_{-\infty}^{f_1} W_x(t,f)\,dfdt}_{C} + \underbrace{\int_{t_1}^{t_2}\int_{f_2}^{\infty} W_x(t,f)\,dfdt}_{D}$$

$$err \cong 1 - \frac{\int_{t_1}^{t_2}\int_{f_1}^{f_2} W_x(t,f)\,dfdt}{\int_{-\infty}^{\infty} |x(t)|^2\,dt}$$



10-2 Modulation and Multiplexing

With the aid of

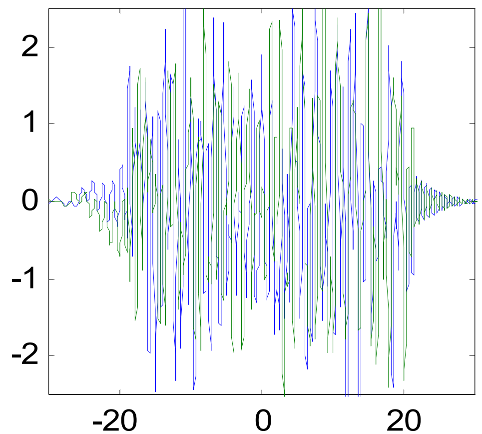
(1) the Gabor transform (or the Gabor-Wigner transform)

(2) horizontal and vertical shifting, dilation, shearing, generalized shearing, and rotation.

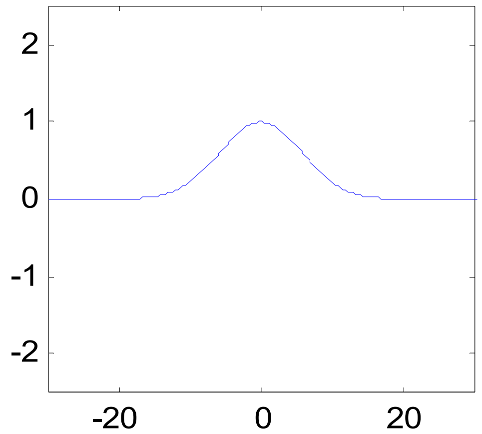
[Ref] C. Mendlovic and A. W. Lohmann, "Space-bandwidth product adaptation and its application to superresolution: fundamentals," *J. Opt. Soc. Am. A*, vol. 14, pp. 558-562, Mar. 1997.

[Ref] S. C. Pei and J. J. Ding, "Relations between Gabor transforms and fractional Fourier transforms and their applications for signal processing," vol. 55, issue 10, pp. 4839-4850, *IEEE Trans. Signal Processing*, 2007.

Example



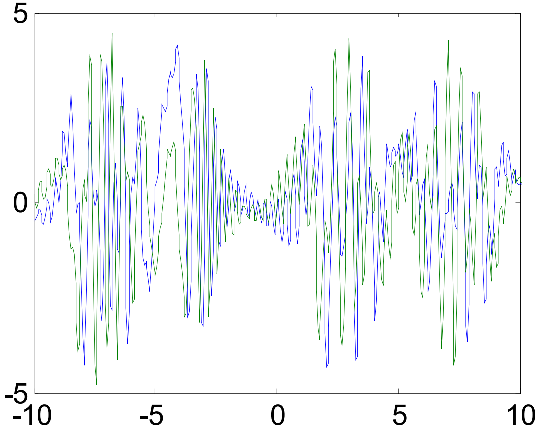
(a) G(u), consisted of 7 components



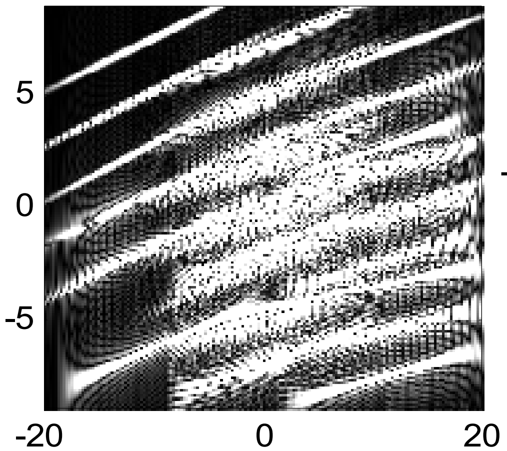
(b) f(t), the signal to be modulated

FT

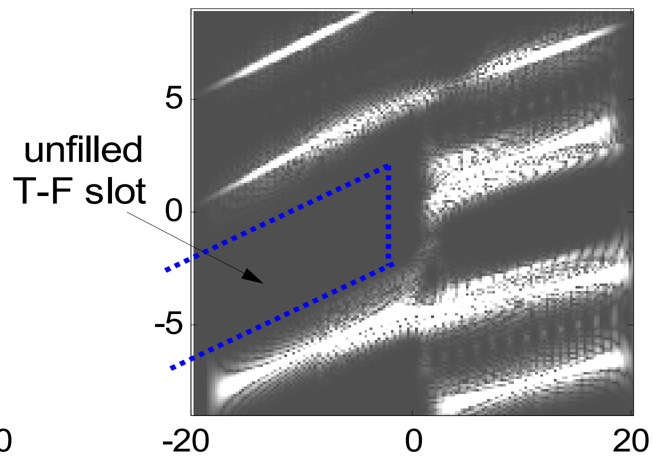
We want to add $f(t)$ into $G(u)$



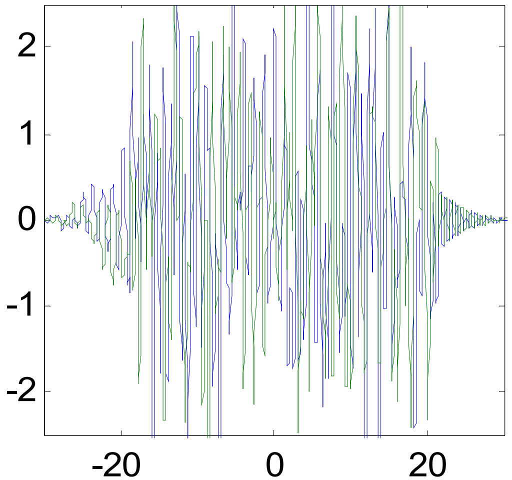
(no empty band)



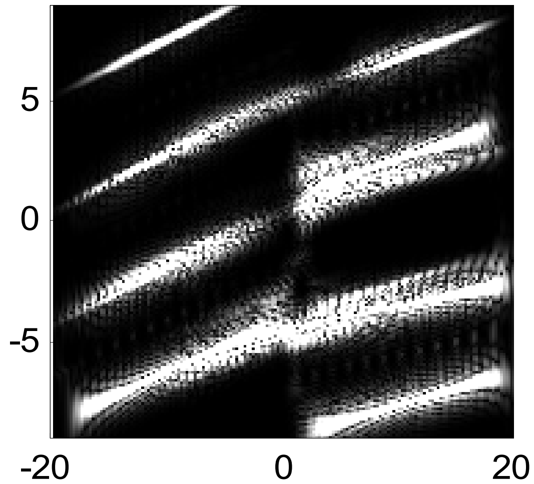
(c) WDF of G(u)



(d) GWT of G(u)



(e) multiplexing f(t) into G(u)



(f) GWT of (e)

◎ Conventional Modulation Theory

The signals $x_1(t)$, $x_2(t)$, $x_3(t)$, ……., $x_K(t)$ can be transmitted successfully if

$$\text{Allowed Bandwidth} \geq \sum_{k=1}^{K} B_k$$

B_k: the bandwidth (including the negative frequency part) of $x_k(t)$

◎ Modulation Theory Based on Time-Frequency Analysis

The signals $x_1(t)$, $x_2(t)$, $x_3(t)$, ……., $x_K(t)$ can be transmitted successfully if

$$\text{Allowed Time duration} \times \text{Allowed Bandwidth} \geq \sum_{k=1}^{K} A_k$$

A_k: the area of the time-frequency distribution of $x_k(t)$

- The interference is inevitable.

How to estimate the interference?

10-3 Electromagnetic Wave Propagation

Time-Frequency analysis can be used for

Wireless Communication

Optical system analysis

Laser

Radar system analysis

Propagation through the free space (Fresnel transform): chirp convolution

Propagation through the lens or the radar disk: chirp multiplication

Fresnel Transform ：描述電磁波在空氣中的傳播 (See pages 269-273)

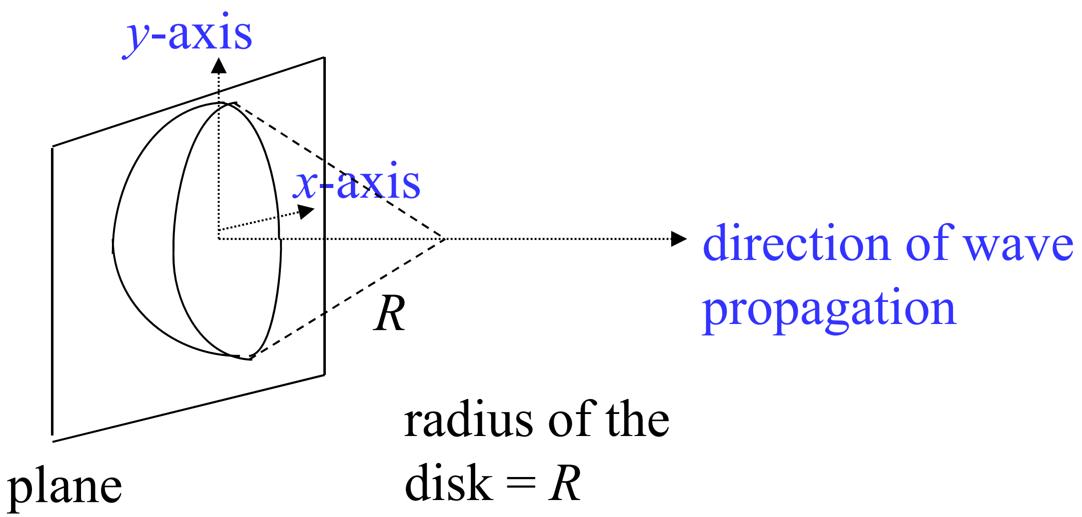
電磁波包括光波、雷達波、紅外線、紫外線………

Fresnel transform == LCT with parameters $\begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} 1 & \lambda z \\ 0 & 1 \end{bmatrix}$

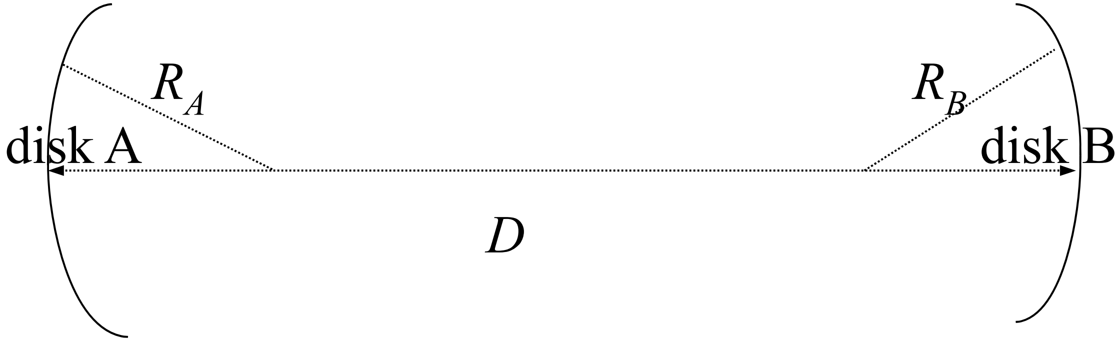
思考： (1) STFT 或 WDF 哪一個比較適合用在電磁波傳播的分析？

(2) 為何波長越短的電磁波，在空氣中散射的情形越少？

(4) Spherical Disk



Disk 相當於 LCT $\begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 1/\lambda R & 1 \end{bmatrix}$ 的情形

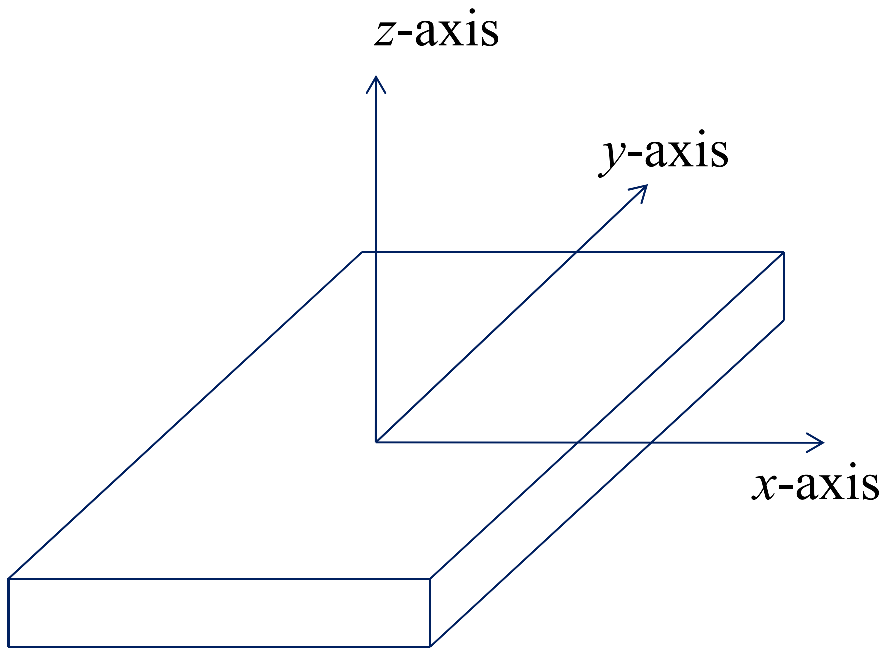


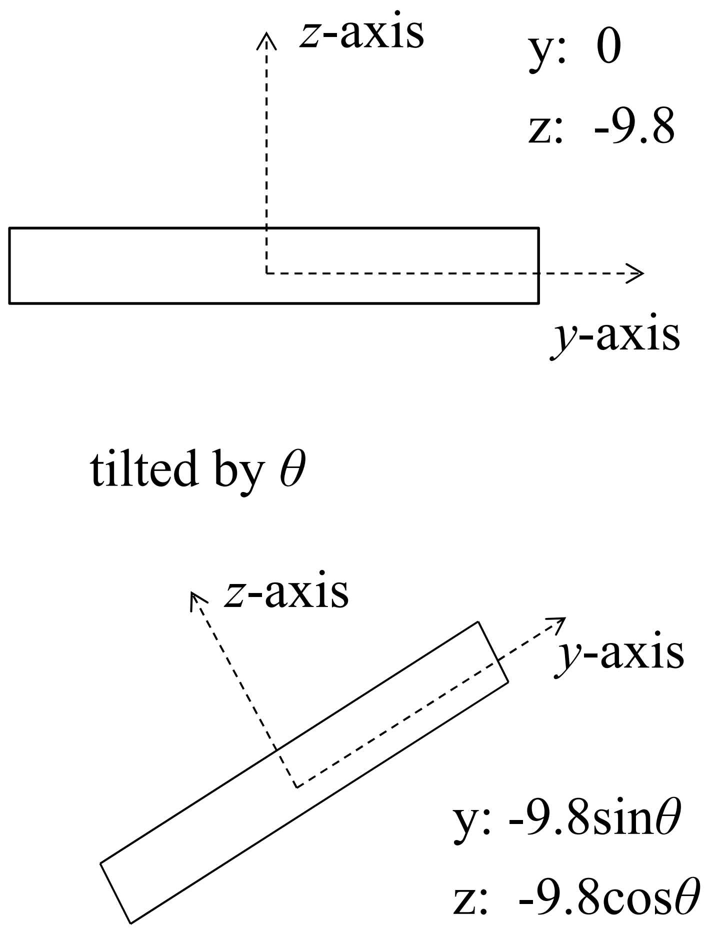
相當於 LCT
$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 1/\lambda R_B & 1 \end{bmatrix} \begin{bmatrix} 1 & \lambda D \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ -1/\lambda R_A & 1 \end{bmatrix}$$
$$= \begin{bmatrix} 1 - D/R_A & -\lambda D \\ -\frac{1}{\lambda}\left(R_A^{-1} - R_B^{-1} + R_A^{-1} R_B^{-1} D\right) & 1 + D/R_B \end{bmatrix}$$

的情形

10-3 Accelerometer Signal Analysis

The 3-D Accelerometer (三軸加速規) can be used for identifying the activity of a person.



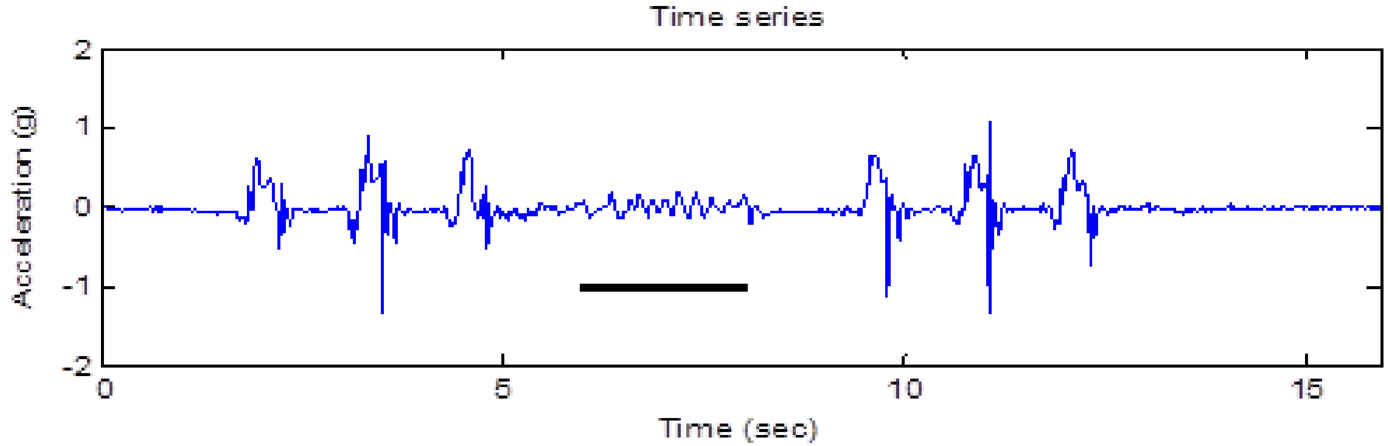


Using the 3D accelerometer + time-frequency analysis, one can analyze the activity of a person.

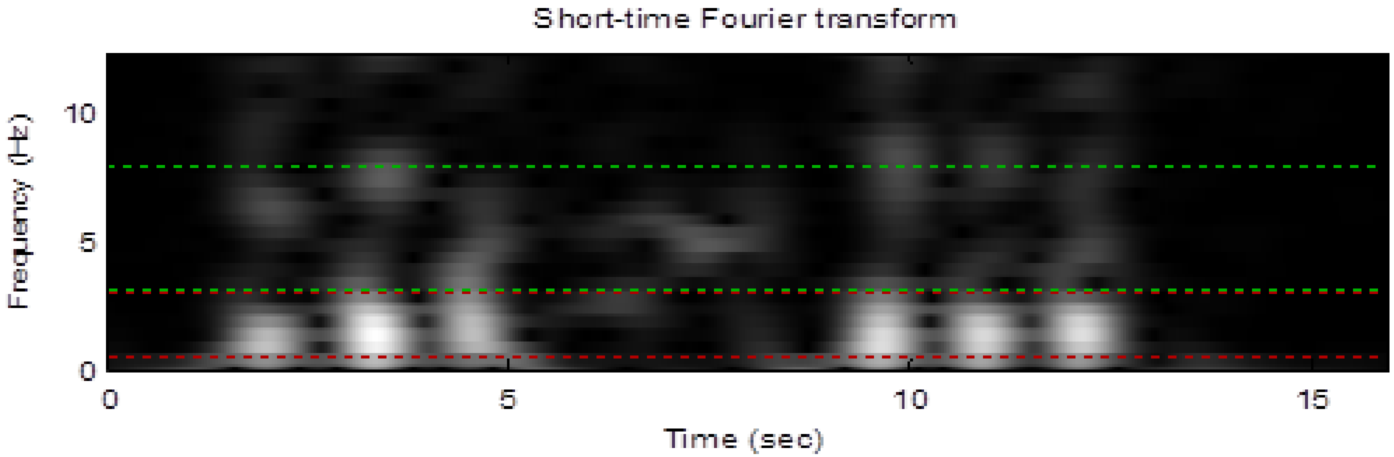
Walk, Run (Pedometer 計步器)

Healthcare for the person suffered from Parkinson’s disease

3D accelerometer signal for a person suffering from Parkinson's disease



The result of the short-time Fourier transform



Y. F. Chang, J. J. Ding, H. Hu, Wen-Chieh Yang, and K. H. Lin, "A real-time detection algorithm for freezing of gait in Parkinson's disease," *IEEE International Symposium on Circuits and Systems*, Melbourne, Australia, pp. 1312-1315, May 2014

10-5 Music and Acoustic Signal Analysis

Music Signal Analysis

Acoustic

Voiceprint (Speaker) Recognition

Speech Signal ：

(1) 不同的人說話聲音頻譜不同 (聲紋 voiceprint)

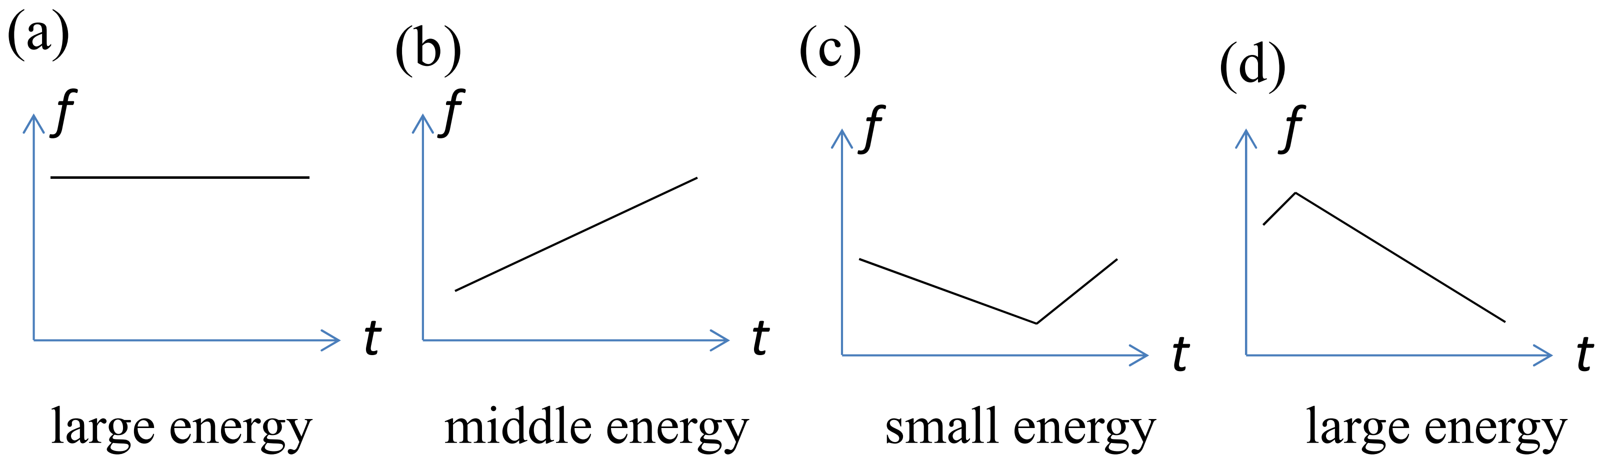
(2) 同一個人但不同的字音，頻譜不一樣

(3) 語調 (第一、二、三、四聲和輕聲) 不同，則頻譜變化的情形也不同

(4) 即使同一個字音，子音和母音的頻譜亦不相同

(5) 雙母音本身就會有頻譜的變化

- 王小川，“語音訊號處理”，第二章，全華出版，台北，民國94年。



Typical relations between time and the instantaneous frequencies for (a) the 1st tone, (b) the 2nd tone, (c) the 3rd tone, and (d) the 4th tone in Chinese.

AD 1965 The Cooley-Tukey algorithm (FFT) was developed

AD 1966 Cohen's class distribution was invented

AD 1970s VLSI was developed

AD 1971 Moshinsky and Quesne proposed the linear canonical transform

AD 1980 The fractional Fourier transform was re-invented by Namias

AD 1981 Morlet proposed the wavelet transform

AD 1982 The relations between the random process and the Wigner distribution function was found by Martin and Flandrin

AD 1988 Mallat and Meyer proposed the multiresolution structure of the wavelet transform;
In the same year, Daubechies proposed the compact support orthogonal wavelet

註：沒列出發明者的，指的是 transform / distribution 的名稱和發明者的名字相同

AD 1989 The Choi-Williams distribution was proposed; In the same year, Mallat proposed the fast wavelet transform

AD 1990 The cone-Shape distribution was proposed by Zhao, Atlas, and Marks

AD 1990s The discrete wavelet transform was widely used in image processing

AD 1992 The generalized wavelet transform was proposed by Wilson et. al.

AD 1993 Mallat and Zhang proposed the matching pursuit;
In the same year, the rotation relation between the WDF and the fractional Fourier transform was found by Lohmann

AD 1994 The applications of the fractional Fourier transform in signal processing were found by Almeida, Ozaktas, Wolf, Lohmann, and Pei;
Boashash and O'Shea developed polynomial Wigner-Ville distributions

AD 1995 Auger and Flandrin proposed time-frequency reassignment

L. J. Stankovic, S. Stankovic, and Fakultet proposed the pseudo Wigner distribution

AD 1996 Stockwell, Mansinha, and Lowe proposed the S transform

Daubechies and Maes proposed the synchrosqueezing transform

AD 1998 N. E. Huang proposed the Hilbert-Huang transform

Chen, Donoho, and Saunders proposed the basis pursuit

AD 1999 Bultan proposed the four-parameter atom (i.e., the chirplet)

AD 2000 The standard of JPEG 2000 was published by ISO

Another wavelet-based compression algorithm, SPIHT, was proposed by Kim, Xiong, and Pearlman

The curvelet was developed by Donoho and Candes

AD 2000s The applications of the Hilbert Huang transform in signal processing, climate analysis, geology, economics, and speech were developed

AD 2002 The bandlet was developed by Mallet and Peyre;
Stankovic proposed the time frequency distribution with complex arguments

AD 2003 Pinnegar and Mansinha proposed the general form of the S transform

Liebling et al. proposed the Fresnelet.

AD 2005 The contourlet was developed by Do and Vetterli;

The shearlet was developed by Kutyniok and Labate

The generalized spectrogram was proposed by Boggiatto, et al.

Data-driven signal decomposition was proposed by Chanyagorn et al.

AD 2006 Donoho proposed compressive sensing

AD 2006~ Accelerometer signal analysis becomes a new application.

AD 2007 The Gabor-Wigner transform was proposed by Pei and Ding

AD 2007 The multiscale STFT was proposed by Zhong and Zeng.

AD 2007~ Many theories about compressive sensing were developed by Donoho, Candes, Tao, Zhang ….

AD 2010~ Many applications about compressive sensing are found.

AD 2012 The generalized synchrosqueezing transform was proposed by Li and Liang

AD 2013 Wave shape function analysis was proposed by Wu.

Variation mode decomposition (VMD) was proposed by Dragomiretskiy and Zosso.

AD 2015~ Time-frequency analysis was widely combined with the deep learning technique for signal identification

The second-order synchrosqueezing transform was proposed by Oberlin, Meignen, and Perrier.

AD 2017 The wavelet convolutional neural network was proposed by Kang et al.

The higher order synchrosqueezing transform was proposed by Pham and Meignen

AD 2018~ With the fast development of hardware and software, the time-frequency distribution of a 10^6-point data can be analyzed efficiently within 0.1 Second

AD 2019 Hybrid deep learning and EMD model was proposed by Yang and Chen.

AD 2022 Learnable empirical mode decomposition was proposed by Velasco-Forero et al.

時頻分析理論與應用未來的發展，還看各位同學們大顯身手

附錄十：幾個常見的資料蒐尋方法

(1) Google 學術搜尋

http://scholar.google.com.tw/

(太重要了，不可以不知道) 只要任何的書籍或論文，在網路上有電子版，都可以用這個功能查得到

輸入關鍵字，或期刊名，或作者

再按「搜尋」，就可找到想要的資料

(2) 尋找 IEEE 的論文

http://ieeexplore.ieee.org/Xplore/guesthome.jsp

(3) Wikipedia

(4) Github (搜尋 code)

(5) ChatGPT (萬事通)

(6) 數學的百科網站

http://eqworld.ipmnet.ru/index.htm

有多個 tables，以及對數學定理的介紹

(7) 傳統方法：去圖書館找資料

台大圖書館首頁 http://www.lib.ntu.edu.tw/

或者去 http://www.lib.ntu.edu.tw/tulips

(8) 查詢其他圖書館有沒有我要找的書

「台大圖書館首頁」→「其他圖書館」

(9) 找尋電子書

「台大圖書館首頁」→「電子書」或「免費電子書」

(10) 查詢一個期刊是否為 SCI

Step 1: 先去 http://scientific.thomson.com/mjl/

Step 2: 在 Search Terms 輸入期刊全名

Search Type 選擇 “Full Journal Title”，再按 “Search”

Step 3: 如果有找到這期刊，那就代表這個期刊的確被收錄在 SCI

(11) 想要對一個東西作入門但較深入的了解:

看 journal papers 會比看 conference papers 適宜

看書會比看 journal papers 適宜

(12) 如果實在沒有適合的書籍，可以看 “review”， “survey”，或 “tutorial” 性質的論文

有了相當基礎之後，再閱讀 journal papers

(以 Paper Title， Abstract， 以及其他 Papers 對這篇文章的描述，來判斷這篇 journal papers 應該詳讀或大略了解即可)
